dplyr functions for data manipulation

Lecture 02: Begining to work with data

January 24 2020

now what?

Describing your data: wha are you working with?

articipation Questio

dplyr functions for dat manipulation

So you have some DATA now what?

are you working with?

articipation statement

So you have some DATA - now what?

- 1. What is a data frame
- 2. Get the data into R
- 3. Figure out what's in the dataset
- Identifying the unit of analysis
- Differentiating between the types of variables
- 4. Manipulate the data frame using the R package dplyr's main functions:
 - rename()
 - ▶ select()
 - arrange()
 - ▶ filter()
 - mutate()
 - group_by()
 - summarize()

So you have some DATA now what?

Describing your data: what are you working with?

dplyr functions for data

- A data frame is a data set.
- ▶ We read data into R from common sources like Excel spreadsheets (.xls or .xlsx), text files (.txt), comma separate value files (.csv), and other formats.
- ▶ The simplest format of data contains one row for each individual in the study.
- The first column of the data identifies the individual (perhaps by a name or an ID variable).
- Subsequent columns are variables that have been recorded or measured.

Lake data from Baldi and Moore (B&M)

- Lecture 02: Begining to work with data
 - So you have some DATA now what?

Describing your data: wha are you working with?

Participation Question

dplyr functions for data manipulation

- Exercise 1.25 from Edition 4 of B&M
- Data from a study of mercury concentration across 53 lakes
- ► I've placed these data in my working directory
- Let's find it there

readr is a library to import data into R

Lecture 02: Begining to work with data

So you have some DATA now what?

Describing your data: who are you working with?

dplyr functions for data

► To access readr's functions we load the library like this:

library(readr)

- Click the green arrow to run the code
- A green rectangle that temporarily appears next to the code shows you that it has run.

read_csv() to load the lake data in R

- Lecture 02: Begining to work with data
- So you have some DATA now what?

Describing your data: what are you working with?

Participation Question

- read_csv() is a function from the readr library used to import csv files.
- code template: your_data <- read_csv("pathway_to_data.csv")</pre>
- ► The <- is called the assignment operator. It says to save the imported data into an object called your_data.

```
lake_data <- read_csv("mercury-lake.csv")</pre>
```

- 1. Execute the above code using either the green arrow
- 2. Note that the data appears in the Environment pane in the top right.
- Notice the number of observations and the number of variables.
- 3. Click the tiny table icon to the right of the lake data in the Environment pane to open the Viewer tab and inspect the data.

So you have some DATA now what?

Describing your data: what are you working with?

rarticipation Question

dplyr functions for da manipulation

Describing your data: what are you working with?

- head(your data): Shows the first six rows of the supplied dataset
- dim(vour data): Provides the number of rows by the number of columns
- names (your data): Lists the variable names of the columns in the dataset
- str(your data): Summarizes the above information and more

```
# notice that if I put a # in front of a line of code it will not run
#head(lake_data)
#dim(lake data)
#names(lake data)
#str(lake data)
```

Unit of analysis

The unit of analysis is the major entity you are working with:

- Bacteria
- ► Laboratory test results
- ► Individual People
- Groups of people (couples, households)
- Villages
- Countries

Which function in R lets us know how many units we have?

Lecture 02: Begining to work with data

So you have some DATA now what?

Describing your data: what are you working with?

Participation Question

dplyr functions for dat

- ► Categorical variable: A variable that has grouping levels. Mathematically you can calculate the proportion (%) of individuals in each level of the category.
 - Nominal variables: have no underlying order or rank. E.g., hospital ID, HIV status (yes/no variables), race
 - Ordinal variables: can be ordered or ranked. E.g., socio-economic status, BMI categories
- Quantitative variable: A continuous, numeric variable that you can perform mathematical operations on. Mathematically, we can you take the median or average of these variables
 - Discrete variables: can be counted. E.g., number of brain lesions, number of previous births
 - Continuous variables: can be measured precisely, with a ruler or scale. E.g, annual income, blood alcohol content, gestational age at birth

Participation Question

So you have some DATA now what?

are you working with?

Participation Question

dplyr functions for data manipulation

dplyr functions for data manipulation

Using dplyr functions for data manipulation

- rename()
- ▶ select()
- arrange()
- filter()
- mutate()
- group_by()
- summarize()

Lecture 02: Begining to work with data

So you have some DATA now what?

Describing your data: what are you working with?

dplyr functions for data manipulation

library(dplyr)

- ▶ These messages mean that some functions (e.g., filter()) share names with functions from other libraries. So, when we use filter() we will now use the dplyr version because the stats library version has been masked.
- ▶ You don't need to worry about masking for now.

What do you think rename does?

First print the names of the variables:

```
names(lake_data)
```

```
## [1] "lakes"
                      "ph"
                                     "chlorophyll" "mercury"
                                                                  "number fish"
   [6] "age data"
```

Run the rename() function and assign it to lake data tidy:

```
lake data tidy <- rename(lake_data, name_of_lake = lakes)</pre>
```

Function 1: rename()

Then reprint the variable names:

```
names(lake_data_tidy)
```

```
## [1] "name_of_lake" "ph" "chlorophyll" "mercury"
## [5] "number_fish" "age_data"
```

Lecture 02: Begining to work with data

So you have some DATA now what?

Describing your data: what are you working with?

dplyr functions for data manipulation

So you have some DATA now what?

Describing your data: wha are you working with?

Participation Question dplyr functions for data

manipulation

You can rename multiple variables at once:

Code template for rename() function

```
new_dataset <- rename(old_dataset, new_name = old_name)
Another way to write the above code is to use the pipe operator: %>%
new_dataset <- old_dataset %>% rename(new_name = old_name)
The pipe will become very useful in a few slides...
```

Lecture 02: Begining to work

So you have some DATA now what?

Describing your data: what are you working with? Participation Question

dplyr functions for data

```
Function 2: select()
```

Based on the output below, what do you think select() does?

```
smaller_data <- select(lake_data, lakes, ph, chlorophyll)
names(smaller_data)</pre>
```

```
## [1] "lakes"
```

"ph"

"chlorophyll"

Lecture 02: Begining to work with data

So you have some DATA now what?

are you working with?

Participation Question

dplyr functions for data manipulation

Function 2: select()

Lecture 02: Begining to work with data

So you have some DATA now what?

Describing your data: wha are you working with?

Participation Question

dplyr functions for data manipulation

- ▶ We use select() to select a subset of variables.
- ► This is very handy if we inherit a large dataset with several variables that we do not need.

```
We can also use "negative select()" to deselect variables. Suppose we wanted to keep all variables except for age data:
```

```
smaller_data_2 <- select(lake_data, - age_data)
names(smaller_data_2)</pre>
```

```
## [1] "lakes" "ph" "chlorophyll" "mercury" "number_fish"
```

We place a negative sign in front of age_data to remove it from the dataset.

```
smaller_data <- lake_data %>% select(lakes, ph, chlorophyll)
smaller_data_2 <- lake_data %>% select(- age_data)
```

- ► Going forward, we will use the pipe operator to write code using any dplyr functions
- ▶ This is because we can use the pipe to stack many dplyr functions in a row

Function 3: arrange()

What does arrange do? First type View(lake data) to look at the original data. Then run the code and examine its output below. What is different?:

```
#View(lake data)
lake data %>% arrange(ph)
```

A tibble: 9×6

```
##
     lakes
                      ph chlorophyll mercury number fish age data
##

```

- ▶ mutate() is one of the most useful functions!
- ▶ It is used to add new variables to the dataset. Suppose that someone told you that the number of fish sampled was actually in hundreds, such that 5 is actually 500. You can use mutate to add a new variable to your dataset that is in the hundreds:

```
lake_data_new_fish <- lake_data %>%
  mutate(actual_fish_sampled = number_fish * 100)
#lake_data_new_fish
```

- We have saved many of new datasets in our environment!
- ▶ If these datasets were larger, they would take up a lot of space.
- ▶ Rather than saving a new dataset each time, we can make successive changes to one dataset like this:

```
tidy_lake_data <- lake_data %>%
  rename(name_of_lake = lakes) %>%
  mutate(actual_fish_sampled = number_fish * 100) %>%
  select(- age_data, - number_fish)
```

▶ When you see "%>%", say the words "and then...". For example, "Take lake_data and then rename lakes to name_of_lake, and then mutate..."

Use %>% to "pipe" several lines of code together

```
tidy_lake_data <- lake_data %>%
    rename(lake_name = lakes) %>%
    mutate(actual_fish_sampled = number_fish * 100) %>%
    select(- age_data, - number_fish)
#tidy_lake_data
```

Lecture 02: Begining to work

So you have some DATA -

Describing your data: wha are you working with?

dplyr functions for data

Function 5: filter()

Lecture 02: Begining to work with data

So you have some DATA now what?

Describing your data: wha are you working with?

Participation Question

dplyr functions for data manipulation

Filter is another very useful function! What might filter() do?

dplyr functions for data manipulation

```
Function 5: filter()ing on numeric variables
```

We use filter to select which rows we want to keep in the dataset. Suppose you were only interested in lakes with ph levels of 7 or higher.

```
lake data filtered <- lake data %>% filter(ph > 7)
lake data filtered
```

```

Another one:

Lecture 02: Begining to work with data

So you have some DATA now what?

Describing your data: what are you working with?

dplyr functions for data

- 1. library() to load readr and dplyr.
- read_csv() to read csv files from a directory.
- 3. head(), str(), dim(), and names() to look at our imported data.
- 4. rename() to rename variables in a data frame.
- 5. select() to select a subset of variables.
- 6. arrange() to sort a dataset according to one or more variables.
- 7. mutate() to create new variables.
- 8. filter() to select a subset of rows.
- 9. group_by() and summarize() to group the data by a categorial variable and calculate a statistic.
- 10. mean() and sd() to calculate the mean and standard deviation of variables.

So you have some DATA now what?

are you working with?
Participation Question

dplyr functions for data manipulation

- 1. Assignment arrow: <-: This is our most important operator!
- 2. Greater than: > There are also:
 - Less than: <</p>
 - Greater than or equal to: >=, and,
 - Less than or equal to: <=</p>
- 3. Is equal to: ==, and != is not equal to
- 4. %in% to select from a list, where the list is created using c(), i.e., lakes %in% c("Alligator", "Annie")

Some of you may want to edit this file in R markdown by adding notes, etc. In that case, you can make your edits on datahub and save your updated file on the cloud. You can additionally save your updated file locally on your computer. Here's how to do that:

- 1. In the File view window, click the checkbox beside the file you'd like to export
- 2. click More > Export.

This will download the file to your computer's downloads folder.

I am really bad with names - I will do my best to remember your name if you speak with me one on one, but if I mess up please forgive me
